

THE ONLY* ONE:

INNOVATIVE DRUG DESIGN AND CO-CRYSTAL LATTICE ENGINEERING

In patients with HF

Azwarda[®]

Sacubitril/Valsartan (50mg/100mg/200mg Tablets)

The **ONE** for **PREDICTABLE** Outcomes

Global standards of quality¹

Significant future risk reduction^{1, #}

Robust clinical evidence:¹

• Efficacy • Safety • Stability

Abbreviated Prescribing Information

Azwarda[®]
COMPOSITION: Tablets - Film-coated tablets containing 50 mg, 100 mg, or 200 mg Sacubitril/Valsartan as sodium salt complex. INDICATIONS: Azwarda[®] is indicated to reduce the risk of cardiovascular death and hospitalisation for heart failure in adult patients with chronic heart failure. Benefits are most clearly evident in patients with Left Ventricular Ejection Fraction (LVEF) below normal. DOSAGE AND ADMINISTRATION: Adults - The target dose of Azwarda[®] is 200 mg twice daily. The recommended starting dose of Azwarda[®] is 100 mg twice daily. A starting dose of 50 mg twice daily is recommended for patients not currently taking an Angiotensin-Converting Enzyme (ACE) inhibitor or an Angiotensin II Receptor Blocker (ARB) and should be considered for patients previously taking low doses of these agents. Double the dose every 2-4 weeks to the target of 200 mg twice daily, as tolerated by the patient. METHOD OF ADMINISTRATION: For oral use. May be administered with or without food. CONTRAINDICATIONS: Hypersensitivity to the active substance, Sacubitril/Valsartan, or any of the excipients. Concomitant use with ACE inhibitors - Azwarda[®] must not be administered until 36 hours after discontinuing ACE inhibitors. Known history of angioedema related to previous ACE inhibitor or ARB therapy. Concomitant use with aliskiren in patients with type 2 diabetes and pregnancy. WARNINGS AND PRECAUTIONS: Dual blockade of the Renin-Angiotensin-Aldosterone System (RAAS) - Azwarda[®] must not be administered with an ACE inhibitor due to the risk of angioedema. Azwarda[®] must not be initiated until 36 hours after taking the last dose of ACE inhibitor therapy. If treatment with Azwarda[®] is stopped, ACE inhibitor therapy must not be initiated until 36 hours after the last dose of Azwarda[®]. Azwarda[®] must not be administered with aliskiren in patients with type 2 diabetes. Azwarda[®] should not be co-administered with an ARB due to the ARB-blocking activity of Azwarda[®]. Concomitant use with aliskiren should be avoided in patients with renal impairment (eGFR < 60 mL/min/1.73 m²). Hypotension - If hypotension occurs, dose adjustment of diuretics, concomitant antihypertensive drugs, and treatment of other causes of hypotension (e.g., hypovolaemia) should be considered. If hypotension persists despite such measures, the dosage of Azwarda[®] should be reduced or the product temporarily discontinued. Impaired renal function - Down titration of Azwarda[®] should be considered in patients who develop a clinically significant decrease in renal function. Caution should be exercised when administering Azwarda[®] in patients with severe renal impairment. Hyperkalaemia - Medications known to raise potassium levels (e.g., potassium-sparing diuretics and potassium supplements) should be used with caution. Monitoring of serum potassium levels is recommended, especially in patients with risk factors such as severe renal impairment, diabetes mellitus, hypoadrenalism, or receiving a high-potassium diet. Angioedema - If angioedema occurs, Azwarda[®] should be discontinued immediately and appropriate therapy and monitoring should be initiated until complete and sustained resolution of signs and symptoms has occurred. Azwarda[®] must not be used in patients with a known history of angioedema related to previous ACE inhibitor or ARB therapy. Patients with renal artery stenosis - Caution is required in patients with renal artery stenosis and monitoring of the renal function is recommended. PREGNANCY, ADVERSE DRUG REACTIONS: The very common adverse reactions are hyperkalaemia, hypotension, and renal impairment. The common adverse reactions are cough, dizziness, renal failure, diarrhoea, hypokalaemia, fatigue, headache, syncope, nausea, asthma, orthostatic hypotension, and vertigo. The events most commonly associated with dosage adjustments or treatment interruptions are hypotension, hyperkalaemia and renal impairment. INTERACTIONS: Concomitant use contraindicated - The concomitant use of Azwarda[®] with aliskiren in patients with type 2 diabetes is contraindicated, concomitant use of Azwarda[®] with ACE inhibitors is also contraindicated. Concomitant use not recommended - ARB, concomitant use of Azwarda[®] with aliskiren, should be avoided in patients with renal impairment (eGFR < 60 mL/min/1.73 m²). Interactions to be considered - Caution should be taken when used concomitantly with statins, sildenafil, lithium, potassium-sparing diuretics (including mineralocorticoid antagonists, potassium supplements, or salt substitutes containing potassium), and Nonsteroidal Anti-Inflammatory Agents (NSAIDs). SPECIAL POPULATION: Pregnancy - Azwarda[®] must not be used during pregnancy. Breastfeeding - It is not known whether Azwarda[®] is excreted in human milk. Because of the potential risk for adverse drug reactions in breastfed newborns or infants, Azwarda[®] is not recommended during breastfeeding. Geriatric patients - No dosage adjustment is required. Paediatric patients - Azwarda[®] has not been studied. Its use is not recommended. Renal impairment - No dosage adjustment is required in patients with mild to moderate renal impairment. In adult patients with severe renal impairment (eGFR < 30 mL/min/1.73 m²), start Azwarda[®] at half the usually recommended starting dose. Hepatic impairment - No dose adjustment is required in patients with mild hepatic impairment. In adult patients with moderate hepatic impairment (Child-Pugh B classification), start Azwarda[®] at half the usually recommended starting dose. In patients with severe hepatic impairment, the use of Azwarda[®] is not recommended. PACKAGING INFORMATION: For more information, please refer to the full prescribing information. DATE OF PREPARATION: March 2023.

Azwarda[®] 50: Pack of 14 tablets (Alu-Alu strips of 2 x14)
Azwarda[®] 100: Pack of 14 tablets (Alu-Alu strips of 2 x14)
Azwarda[®] 200: Pack of 7 tablets (Alu-Alu strips of 2x7)

Intake of Potassium in Heart Failure

Intake of Potassium in Heart Failure

- Potassium is a mineral that is crucial for normal cell function in the body, including the heart.
- The right level of potassium is the key.
- An abnormal level of potassium can interfere with proper rhythmic beating of the heart.

A high potassium level (Hyperkalaemia) can be just as harmful as a low level (Hypokalaemia).

What causes hypokalaemia and hyperkalaemia in heart failure?

Hypokalaemia

- Increased potassium excretion (medicines like diuretics)
- Insufficient potassium intake

You may need to increase your dietary potassium intake.

Hyperkalaemia

- ACE inhibitors, ARBs, & aldosterone antagonists increase potassium level.
- Other conditions like diabetes and kidney disease

You may need to lower your dietary potassium intake.

Keep a watch on your potassium levels

- Regularly discuss with your doctor about your blood potassium level and how much potassium containing food you should eat.
- Mild cases may be easy to treat.
- If your potassium level is very high, or if there are significant changes in an ECG, emergency treatment may be required.

What should I do if my blood potassium level is high?

Avoid potassium-rich foods.

Read food labels carefully and avoid foods high in potassium.

Soak or boil vegetables and fruits in water before you eat.

Avoid juices from canned or frozen fruits and vegetables.

Potassium rich food to be remembered

- Vegetables: Broccoli, Potato, Avacado, Tomato, leafy greens, Mushroom, Cucumber, Peas, Eggplant
- Fresh fruits: Banana, Orange, Kiwi, Mango, Peach, Papaya
- Coconut water
- Dairy: Low fat milk, Yogurt
- Dried fruits: Resins, Prunes, Apricots, Dates
- Salt substitutes that contain potassium chloride
- Protein: Tofu, Fish, Lean Meat
- Canned juices

Discuss with your doctor about your blood potassium level and intake of potassium.

ACE: Angiotensin Converting Enzyme; ARB: Angiotensin Receptor Blocker

હાર્ટ ફેલ્ચોરમાં પોટેશિયમનું સેવન

- પોટેશિયમ એ મિનરલ છે જે શરીર સહિત હૃદયમાં કોષોની સામાન્ય કામગીરી માટે ખૂબ મહત્વનું છે.
- પોટેશિયમનું ઊચિત સ્તર ચાવી છે.
- પોટેશિયમનું અસામાન્ય સ્તર હૃદયની યોગ્ય લયબદ્ધ ગતિમાં હસ્તક્ષેપ કરી શકે છે.

પોટેશિયમનું ઊચ્ચ સ્તર (હાઇપરકેલેમિયા) પણ એટલું જ હાનિકારક બની શકે છે જેટલું કે તેનું ઓછું સ્તર (હાઇપોકેલેમિયા)

હાર્ટ ફેલ્ચોરમાં હાઇપોકેલેમિયા અને હાઇપરકેલેમિયા થવાનાં કારણો કયા છે?

હાઇપોકેલેમિયા

- પોટેશિયમનો સાવ વધી જવો (ડાયયુરેટિક્સ જેવી દવાઓ)
- પોટેશિયમનું અપૂરતું સેવન

તમારે તમારા આહારગત પોટેશિયમની માત્રામાં વધારો કરવો જરૂરી બની શકે છે.

હાઇપરકેલેમિયા

- એસ ઈન્હિબિટર્સ, એઆરબી અને એલ્ડોસ્ટેરોન એન્ટાગોનિસ્ટ્સ પોટેશિયમના સ્તરમાં વધારો કરે છે.
- ડાયાબિટીસ અને કિડનીના રોગ જેવી અન્ય સ્થિતિઓ.

તમારા આહારમાં મળતા પોટેશિયમના તમારા સ્તરમાં ઘટાડો કરવો જરૂરી બની શકે છે.

તમારા પોટેશિયમના સ્તર પર નજર રાખો

- તમારા ડૉક્ટર સાથે તમારા બ્લડ પોટેશિયમ લેવલ વિશે અને કેટલા પ્રમાણમાં પોટેશિયમ ધરાવતો આહાર તમારે લેવો જોઈએ એ વિશે નિયમિત ચર્ચા કરો.
- હળવા કેસોમાં સારવાર સરળ હોઈ શકે છે.
- જો તમારું પોટેશિયમ લેવલ ઘણું વધારે હોય અથવા જો ઈસીજીમાં નોંધપાત્ર ફેરફારો જોવા મળે તો અત્યાવશ્યક સારવાર જરૂરી બની શકે છે.

જો મારું બ્લડ પોટેશિયમ લેવલ વધારે હોય તો મારે શું કરવું જોઈએ?

પોટેશિયમથી સમૃદ્ધ આહાર લેવાનું ટાળો

ફૂડ લેબલ્સ ધ્યાનથી વાંચો અને વધુ પોટેશિયમ ધરાવતી વસ્તુઓ ખાવાનું ટાળો.

શાકભાજી અને ફળોને ખાતા પહેલા પલાળી રાખો અથવા બાફી લો.

કેનમાં મળતા રસો અથવા ફ્રોઝન કરેલા ફળો અને શાકભાજી ખાવાનું ટાળો.

યાદ રાખવા યોગ્ય પોટેશિયમથી સમૃદ્ધ આહાર

- શાકભાજી: બ્રોકોલી, બટેટા, એવોકાડો, ટમેટા, પાનવાળી ભાજી, મશરૂમ, કાકડી, વટાણાં, એગપ્લાંટ
- તાજા ફળો: કેળા, સંતરા, કિવી, કેરી, પીચ, પપૈયું
- નાળિયેર પાણી
- સૂકા ફળો: કિસમિસ, પ્રુન્સ, એપ્રિકોટ્સ, ખારેક
- પ્રોટીન: ટોફુ, માછલી, કાચું માંસ
- દુધ ઉત્પાદનો: ઓછી ફેટ ધરાવતું દૂધ, ગળ્યું દહીં (યોગર્ટ)
- પોટેશિયમ ક્લોરાઇડ ધરાવતા મીઠાંના પૂરકો
- કેનમાં મળતા જ્યુસ

તમારા બ્લડ પોટેશિયમ લેવલ અને પોટેશિયમના સેવન વિશે તમારા ડૉક્ટર સાથે ચર્ચા કરો.
